

BALE STACKING GUIDE

Here's an idea to help keep your bales and other materials stacked at the nominal height. Determine the maximum height you will allow your materials to be stacked. Then, paint a highly visible stripe at that height on the posts in your warehouse. Instruct your operators to stack material below that point. Stacking above that mark would not be allowed. This practice eliminates the potential problem in using a number to determine the maximum bales to be stacked. It also keeps barrels and other containers within a height that is more easily controlled.
